## Edge Event Management System

Edge analytics provide a useful tool to move processing to the edge, and cut down on server based processing, but provide limited tools for event presentation and analysis. Our unique Edge Event Management System changes all that.

This light-weight solution can receive event data from the ACAP events, and present it in a searchable, graphical manner. The application can create compound events out of disparate alarms; for instance, send a notification only when an event is triggered in two cameras. And can provide a floormap view of events in the facility.

An out of the box solution that is easy to set up and run, the Edge Event Management System provides the best of both worlds. All of the processing is done on the edge, but events are sent to the management system, and saves, allowing you to quickly generate counts of people entering a store, of vehicles leaving a lot, or any other event of interest. This information can be searched by time and event type, and graphed, providing easily understood and shared representations.

This management system is compatible with all of our Axis Edge Analytics: Activity, Line Crossing, Object Taken, and Zone Intrusion.
